

Calculating the DTFS of signals

Fourier Series

- Periodic signal with period T or N
- Synthesis equation:

$$x(t) = \sum_{k=-\infty}^{+\infty} a_k e^{jk\left(\frac{2\pi}{T}\right)t} \quad v.s.$$

$$x[n] = \sum_{k=0}^{N-1} a_k e^{jk\left(\frac{2\pi}{N}\right)n}$$

- Analysis equation:

$$a_k = \frac{1}{T} \int_T x(t) e^{-jk\left(\frac{2\pi}{T}\right)t} dt \quad v.s.$$

$$a_k = \frac{1}{N} \sum_{n=0}^{N-1} x[n] e^{-jk\left(\frac{2\pi}{N}\right)n}$$

Why not
 $-\infty \sim +\infty$?

Summation of **N**
 harmonic components

relation?
 $a_k \longleftrightarrow a_{k+N}$

Complexity Analysis

- Suppose we know the matrix

$$E(n, k) = e^{-jk\left(\frac{2\pi}{N}\right)n}$$

- How many multiplications & additions are needed to calculate Fourier series $[a_0, a_1, \dots, a_{N-1}]$

One Period

$$a_0 = \frac{1}{N} \sum_{n=0}^{N-1} x[n]E(n, 0)$$

...

$$a_{N-1} = \frac{1}{N} \sum_{n=0}^{N-1} x[n]E(n, N-1)$$

Each: $N + 1 \times$; $N - 1 +$

Total: $N(N + 1) \times$; $N(N - 1) +$

Fast Fourier Transform (FFT)

- Fast Fourier Transform: Calculation of Fourier series (transform) can be speeded up

- Complexity reduces to $O(N \log N)$

$$E(n, k) = e^{-jk\left(\frac{2\pi}{N}\right)n}$$

$$N = 4$$

$$a_0 = (x[0]E(0,0) + x[1]E(1,0) + x[2]E(2,0) + x[3]E(3,0))/N$$

$$a_2 = (x[0]E(0,2) + x[1]E(1,2) + x[2]E(2,2) + x[3]E(3,2))/N$$

$$a_1 = (x[0]E(0,1) + x[1]E(1,1) + x[2]E(2,1) + x[3]E(3,1))/N$$

$$a_3 = (x[0]E(0,3) + x[1]E(1,3) + x[2]E(2,3) + x[3]E(3,3))/N$$

$$E(1,1) = -E(1,3); E(2,1) = E(2,3); E(3,1) = -E(3,3);$$

- To calculate the DTFS and FFT of a 1024×1024 image:

CPU	Clock Frequency	DTFS	FFT
1941	60 Hz	152.3 y	271.4 d
1971 (4004)	108KHz	30.8 d	3.6 h
1978 (8086)	10MHz	8.0 h	2.3 min
1982 (80286)	20MHz	4.0 h	1.2min
1985 (80386)	33MHz	2.4h	42.6s
1989 (80486)	100MHz	48.0min	14.1s
1995 (Pentium)	200MHz	24.0min	7.0s
1999 (Pentium III)	450MHz	10.7min	3.1s
2000 (Pentium 4)	1.4GHz	3.4min	1.0s
2001 (Pentium 4)	2GHz	2.4min	0.7s

Matlab Function: fft()

- `fft()`: compute DTFS coefficients from signals

```
>> help fft
```

$$X(k) = \sum_{n=1}^N x(n) \cdot \exp(-j \cdot 2 \cdot \pi \cdot (k-1) \cdot (n-1) / N), \quad 1 \leq k \leq N.$$

$$a_k = \sum_{n=1}^N x[n] e^{-j(k-1)\left(\frac{2\pi}{N}\right)(n-1)}, \quad 1 \leq k \leq N$$

- Compare with our definition: $a_k = \frac{1}{N} \sum_{n=0}^{N-1} x[n] e^{-jk\left(\frac{2\pi}{N}\right)n}, \quad 0 \leq k \leq N-1$

- Calculate the DTFS of vector x:

$$a = (1/N) * \text{fft}(x)$$

Matlab Function: ifft()

- `ifft()`: reconstruct signals from DTFS coefficients

- Matlab definition:

$$x[n] = \frac{1}{N} \sum_{k=1}^N a_k e^{j(k-1)\left(\frac{2\pi}{N}\right)(n-1)}$$

- Compare with our definition:

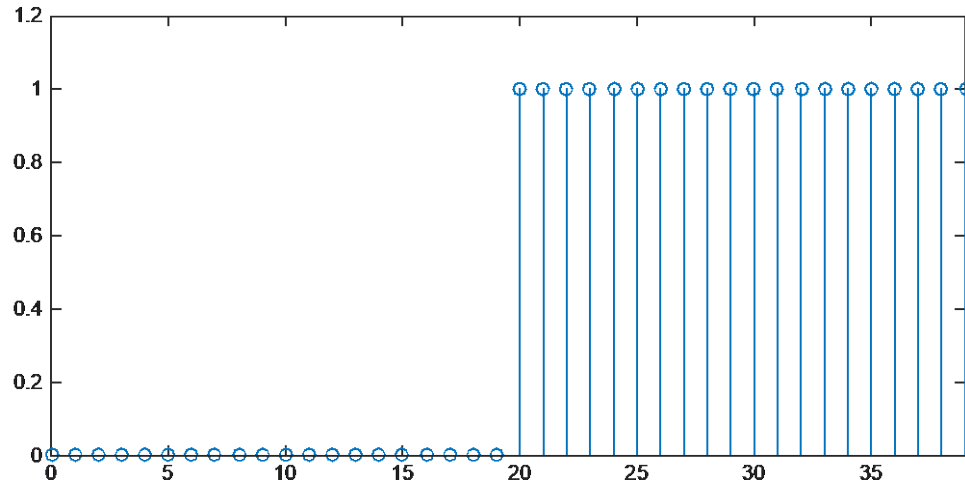

$$x[n] = \sum_{k=0}^{N-1} a_k e^{jk\left(\frac{2\pi}{N}\right)n}$$

- Calculate the DTFS of vector `x`:

$$x = N * \text{ifft}(a)$$

Example

- Periodic DT rectangular wave with period = 40

```
x=[zeros(1,20) ones(1,20)];  
stem(0:39, x);  
xlim([0 39]);  
ylim([0 1.2]);
```

```
A = fft(x) / length(x);
```

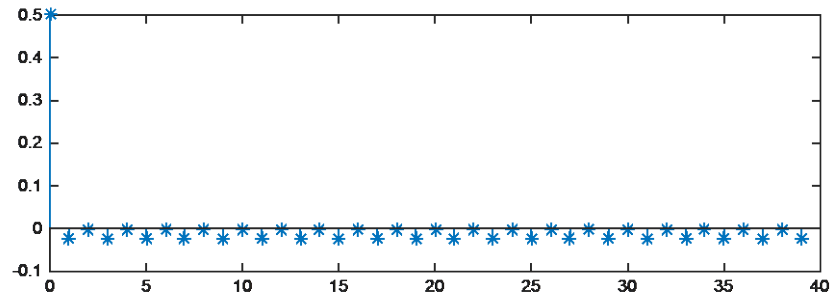

```
subplot(2,1,1), stem(0: length(x)-1,real(A),'*-');
```

Plot the real part

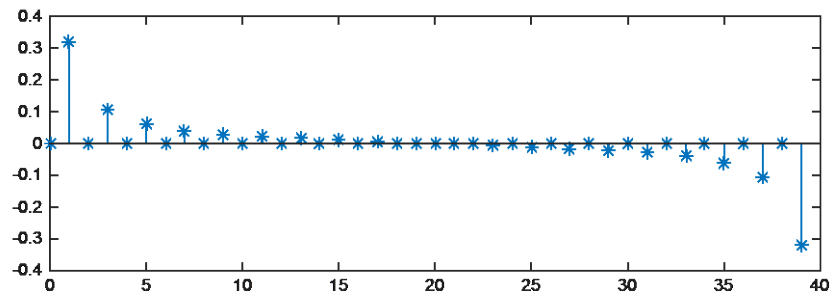

```
subplot(2,1,2), stem(0: length(x)-1,imag(A),'*-');
```

Plot the imaginary part

Real Part:

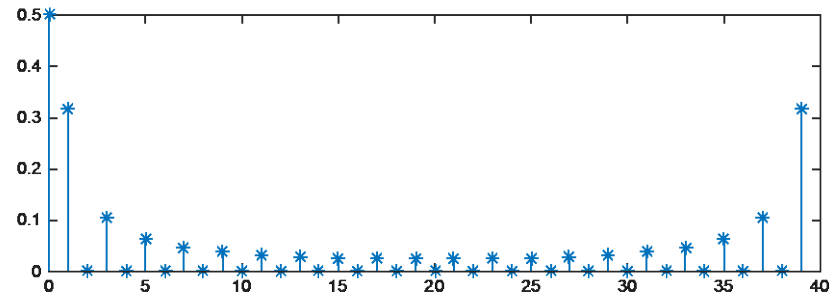

Imaginary Part:

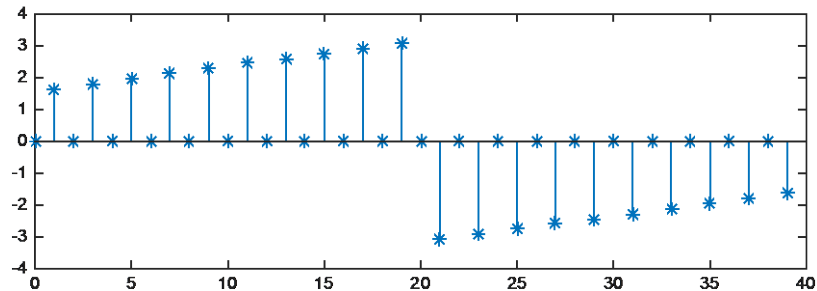

```
subplot(2,1,1), stem(0: length(x)-1,abs(A),'*-'); ← Plot the magnitude  
subplot(2,1,2), stem(0: length(x)-1,angle(A),'*-'); ← Plot the phase
```

Magnitude:

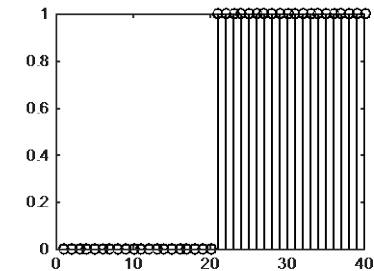

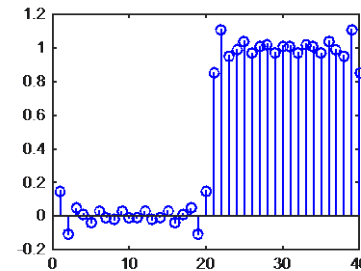

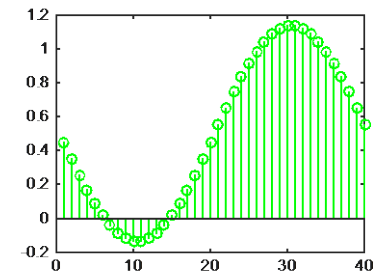

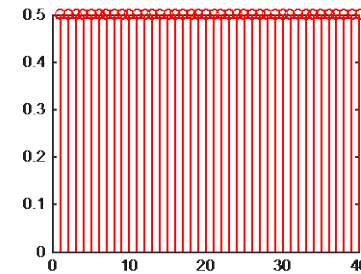

Phase:

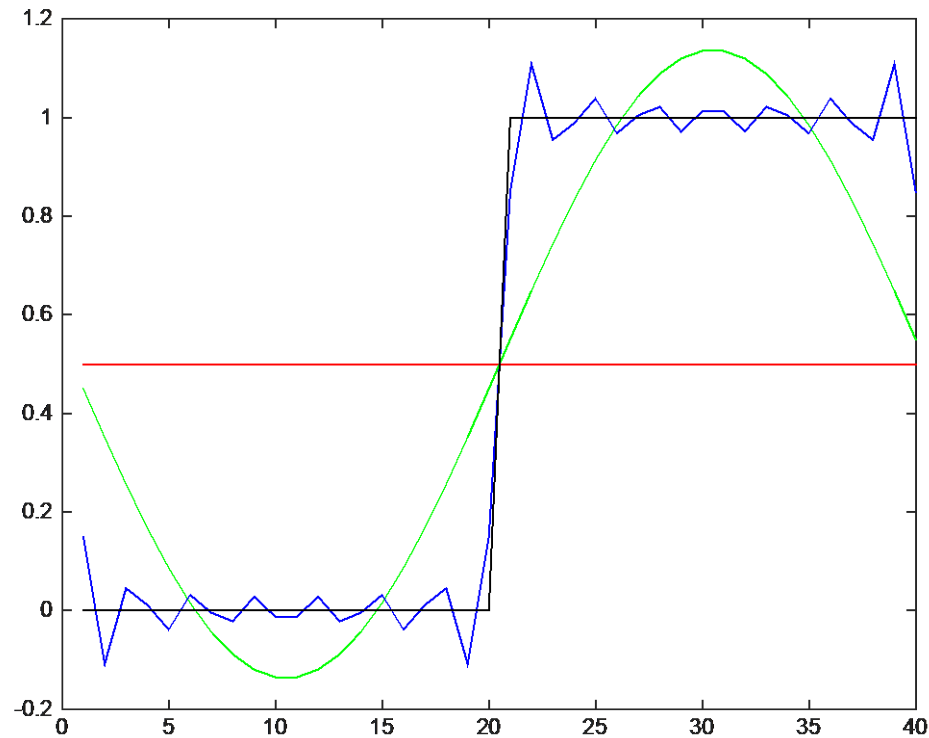

Matlab definition: $a_k = \sum_{n=1}^N x[n] e^{-j(k-1)\left(\frac{2\pi}{N}\right)(n-1)}$, textbook definition: $a_k = \frac{1}{N} \sum_{n=0}^{N-1} x[n] e^{-jk\left(\frac{2\pi}{N}\right)n}$,
 $1 \leq k \leq N$ $0 \leq k \leq N-1$

```
newA1 = [A(1) zeros(1,39)];
newA2 = [A(1) A(2) zeros(1,37) A(40)];
newA3 = [A(1) A(2:15) zeros(1,11) A(27:40)];

subplot(2,2,1), stem(1:40,ifft(newA1)*40, 'r');
subplot(2,2,2), stem(1:40,ifft(newA2)*40, 'g');
subplot(2,2,3), stem(1:40,ifft(newA3)*40, 'b');
subplot(2,2,4), stem(1:40,x, 'k');
```

```
plot(1:40,ifft(A1)*40, 'r', 1:40,ifft(A2)*40, 'g', 1:40,ifft(A3)*40, 'b', 1:40,x, 'k');
```

逃课大学生的末日！老师启用“点名神器”

2018年04月19日 10:19 中青在线

一位女生说，第一次用这种方式点名就被点到了，转发抽奖都没中过，内心很崩溃。

Lab Assignment 3 (b)

- Read tutorial 3.1, 3.2 & 3.3 by yourself
- 3.5, 3.8(c-f) & 3.10

Lab Assignment 3 summary

- Read tutorial 3.1, 3.2 & 3.3 by yourself
- 3.5, 3.8, 3.9 & 3.10
- Submit your report + codes onto Blackboard before **10:00 am Nov. 5th**

Hints & Tips

- 3.5
 - The DTFS coefficients of a periodic discrete-time signal with **period N = 5**:

$$a_0 = 1, \quad a_2 = a_{-2}^* = e^{j\pi/4}, \quad a_4 = a_{-4}^* = 2e^{j\pi/3}.$$

- $a_1 = ?$
- $a_3 = ?$

- 3.10 (b) & (c)

- Suggested in the lab book: measure the number of operations by using the internal flops 'flops'

```
x = (0.9).^[0:N-1];  
flops(0);  
X = dtfs(x,0);  
c = flops;
```

- To measure the elapsed time by a function, you can choose one of the followings:

- etime
- tic, toc
- timeit

flops: This is an obsolete function

- Measure the function performance difference by comparing the time cost by functions rather than numbers of floating point operations.
- Try to keep the PC conditions unchanged while measuring the functions timecosts

- etime

```
t0 = clock;  
X = dtfs(x,0);  
dtfstime = etime(clock,t0);
```

```
t1 = clock;  
X2 = fft(x);  
fftttime = etime(clock,t1);
```

The `clock` function returns the current date and time as a date vector, system clock

The command `etime` will allow you to measure the elapsed time between the start and finish of your implementation

`etime(T1,T0)` returns the time in seconds that has elapsed between vectors T1 and T0

- tic, toc

```
tic  
X = dtfs(x,0);  
toc
```

```
tic  
X2 = fft(x);  
toc
```

tic starts a stopwatch timer to measure performance. The function records the internal time at execution of the **tic** command. Display the elapsed time with the **toc** function

- `timeit`

```
f1 = @()dtfs(x,0);  
t1_timeit = timeit(f1)
```

```
f2 = @()fft(x)  
t2_timeit = timeit(f2)
```

`t = timeit(f)` measures the typical time (in seconds) required to run the function specified by the function handle `f`

To measure performance, it is recommended to use the **timeit** or **tic** and **toc** functions

*If your PC is so good that the time cost by fft is always 0,
try to increase the value of N. 😊
Or, put your codes in a for-loop,*

Tips

- 3.10 Periodic Convolution with the FFT
 - Periodic convolution in time domain is equivalent to multiplication in frequency domain

$$x[n] \otimes \hat{h}[n] = \sum_{r=0}^{N-1} x[r] \hat{h}[n-r] \Leftrightarrow N a_k h_k$$

Table 3.2 in Textbook
Section 3.7.1 multiplication (property)

$$y[n] = x[n] * h[n] = x[n] \otimes \hat{h}[n]$$

$\hat{h}[n]$ is a periodic version of $h[n]$

`conv([x x],h).` The periodic convolution can be extracted from a portion of this signal.

- Any question?
